

WATER ACCESS AND QUALITY ASSESSMENT

About

Overview

Detailed view

About the project

This project analyzes water quality and related health issues reported by communities across various regions, drawing from real-time survey data collected from local communities. The data includes water source conditions, maintenance practices, and health problems related to poor water quality, such as diarrhea, cholera, and intestinal worms.

Key Features

1.Data Source

- KoboToolBox form designed to resemble real-world data collection efforts in water management and public health.

2.Real-time reporting

- Data captured in KoboToolBox is linked to Power BI that automatically updates reports about new submissions.

Value of the Data and Reports

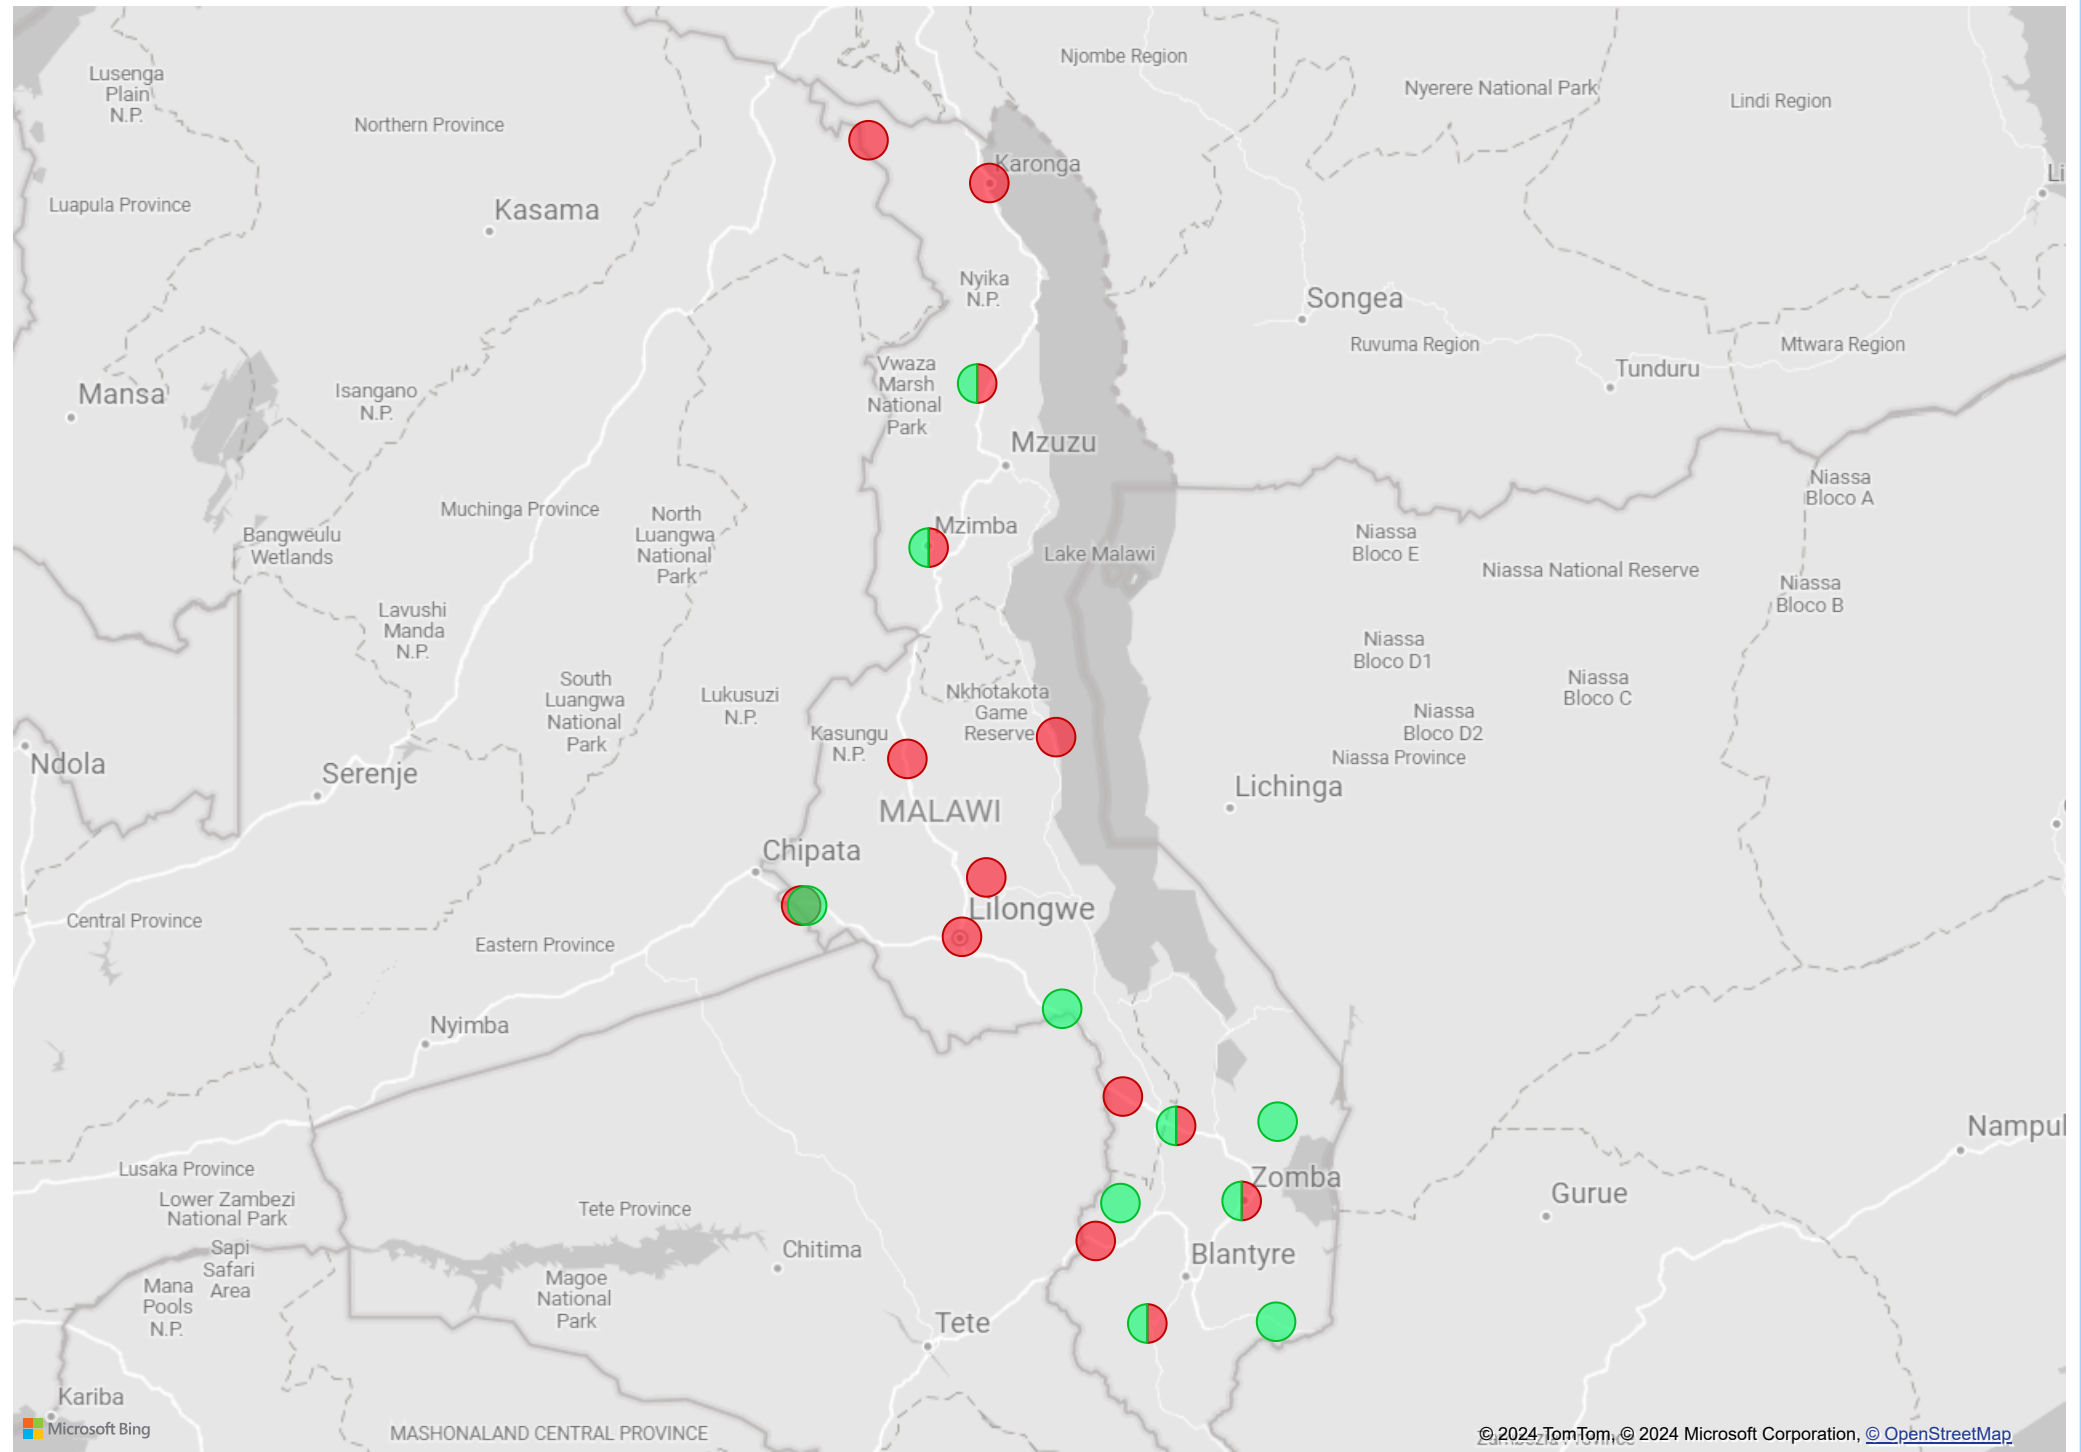

1. Identifying High-Risk Areas

- The reports highlight regions with non-functional or poor-quality water sources, and where health problems like diarrhea are most prevalent.

2. Driving Action

- Health and government officials can use this knowledge to prioritize water infrastructure improvements in areas with the greatest need.
